

Hydraulic Modelling of wetland flow

Data collection and problem solving

Prof. dr. ir. Ronny Verhoeven
Hydraulics Laboratory
Ghent University
Belgium

Hydraulic Modelling of wetland flow

- **Introduction**
- **Hydraulic modelling of open channel flow**
- **Extension to wetlands**
- **Data collection – problems, questions, solutions**
- **Input data – problems, questions, solutions**
- **Conclusions - questions**

Introduction

Engineer >>
translates reality
into formula

Deterministic approach is
what he likes: $p = \rho g h$

Stochastic representation is
what he needs to live with

Introduction

Hydraulic Modelling of open Channel Flow

Supositions

- Uniform velocity distribution: $Q = A \cdot U$
- Prismatic bed – constant cross-section
- Hydrostatic cross sections
- Constant bottom slope
- Constant friction factor

Hydraulic Modelling of open Channel Flow

Steady state

Continuity:

$$Q = A \cdot U$$

Motion – Bresse equation:

$$\frac{\delta h}{\delta x} = \frac{S_0 - S_f}{\sqrt{1 - S_0^2} - \frac{BQ^2}{gA^3}}$$

Uniform flow
>> Manning <<

$$U = 1/n \cdot R^{2/3} \cdot S_0^{1/2}$$

Hydraulic Modelling of open Channel Flow

Unsteady state

Saint Venant equations

Continuity:
$$\frac{\delta Q}{\delta x} + B \frac{\delta h}{\delta t} = 0$$

Motion:
$$\frac{\delta Q}{\delta t} + \frac{\delta}{\delta x} \left(\frac{Q^2}{A} \right) = g.A..(S_o - S_f - \frac{\delta h}{\delta x})$$

Hydraulic Modelling of open Channel Flow

Unsteady state

**Saint Venant equations – solved by implicit
finite difference Preismann scheme**

>> choice of Θ is important > stability

>> choice of Δs and Δt also > accuracy

Extension to wetlands

Quasi 2D modelling

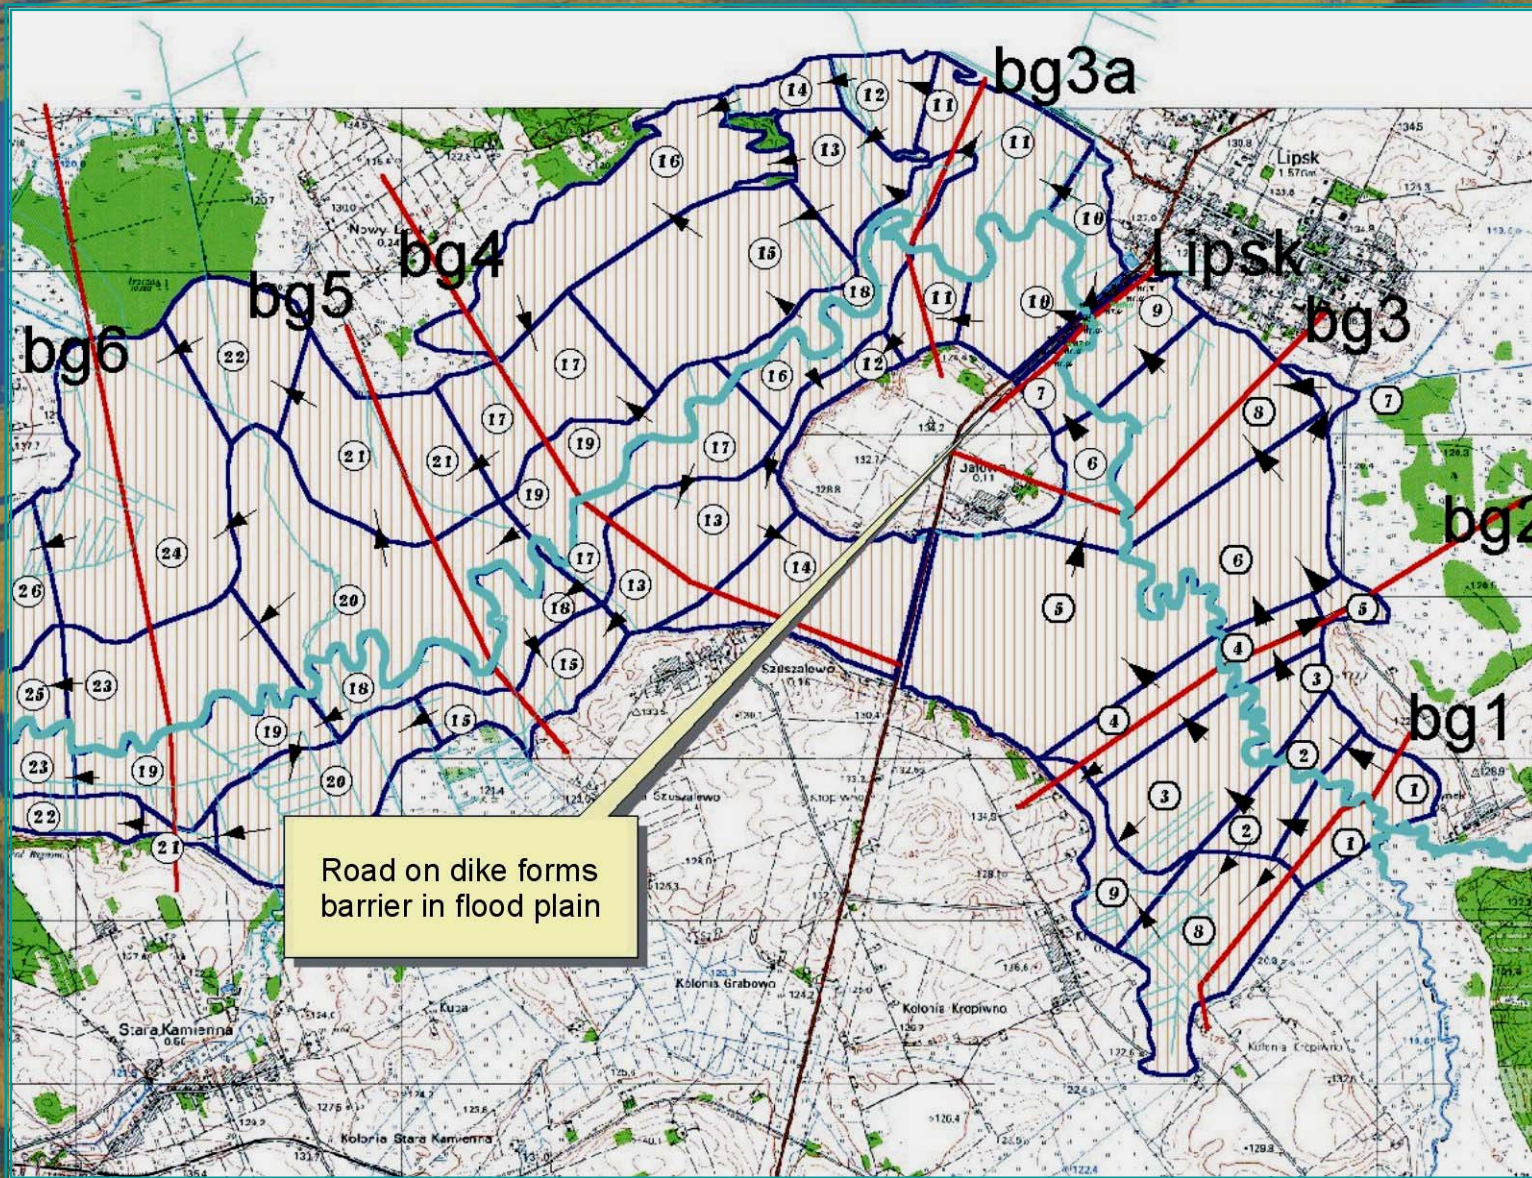

>> Network structure - flow

>> Cells - exchange of volumes

>> Combination - what to choose?

Road on dike forms barrier in flood plain

Input data – what do we need?

Topographical

- **Cross-sections of river and floodplain**
- **Longitudinal profile (Thalweg)**
- **Water levels ($f(t)$)**

Hydraulic

- **Discharge ($f(t)$) – lateral discharges**
- **Friction coefficients**
- **Sediment transport (bottom / suspended)**

Data collection

Topographical

- ? Distance between 2 cross-sections
- ? Boundaries of flood plains
- Altitude measurements should be the most accurate ones
- Accuracy of measurements is influenced by:
 - mud
 - vegetation
 - obstacles in cross-section
 - soft bottom

Data collection

Hydraulic data – discharge measurements

- Integration of velocity field over cross-section
- Propeller meter or electromagnetic, acoustic velocity meter
- From bridge or from boat

Data collection

Hydraulic data – discharge measurements > Problems <

- Velocity distribution – horizontal / vertical

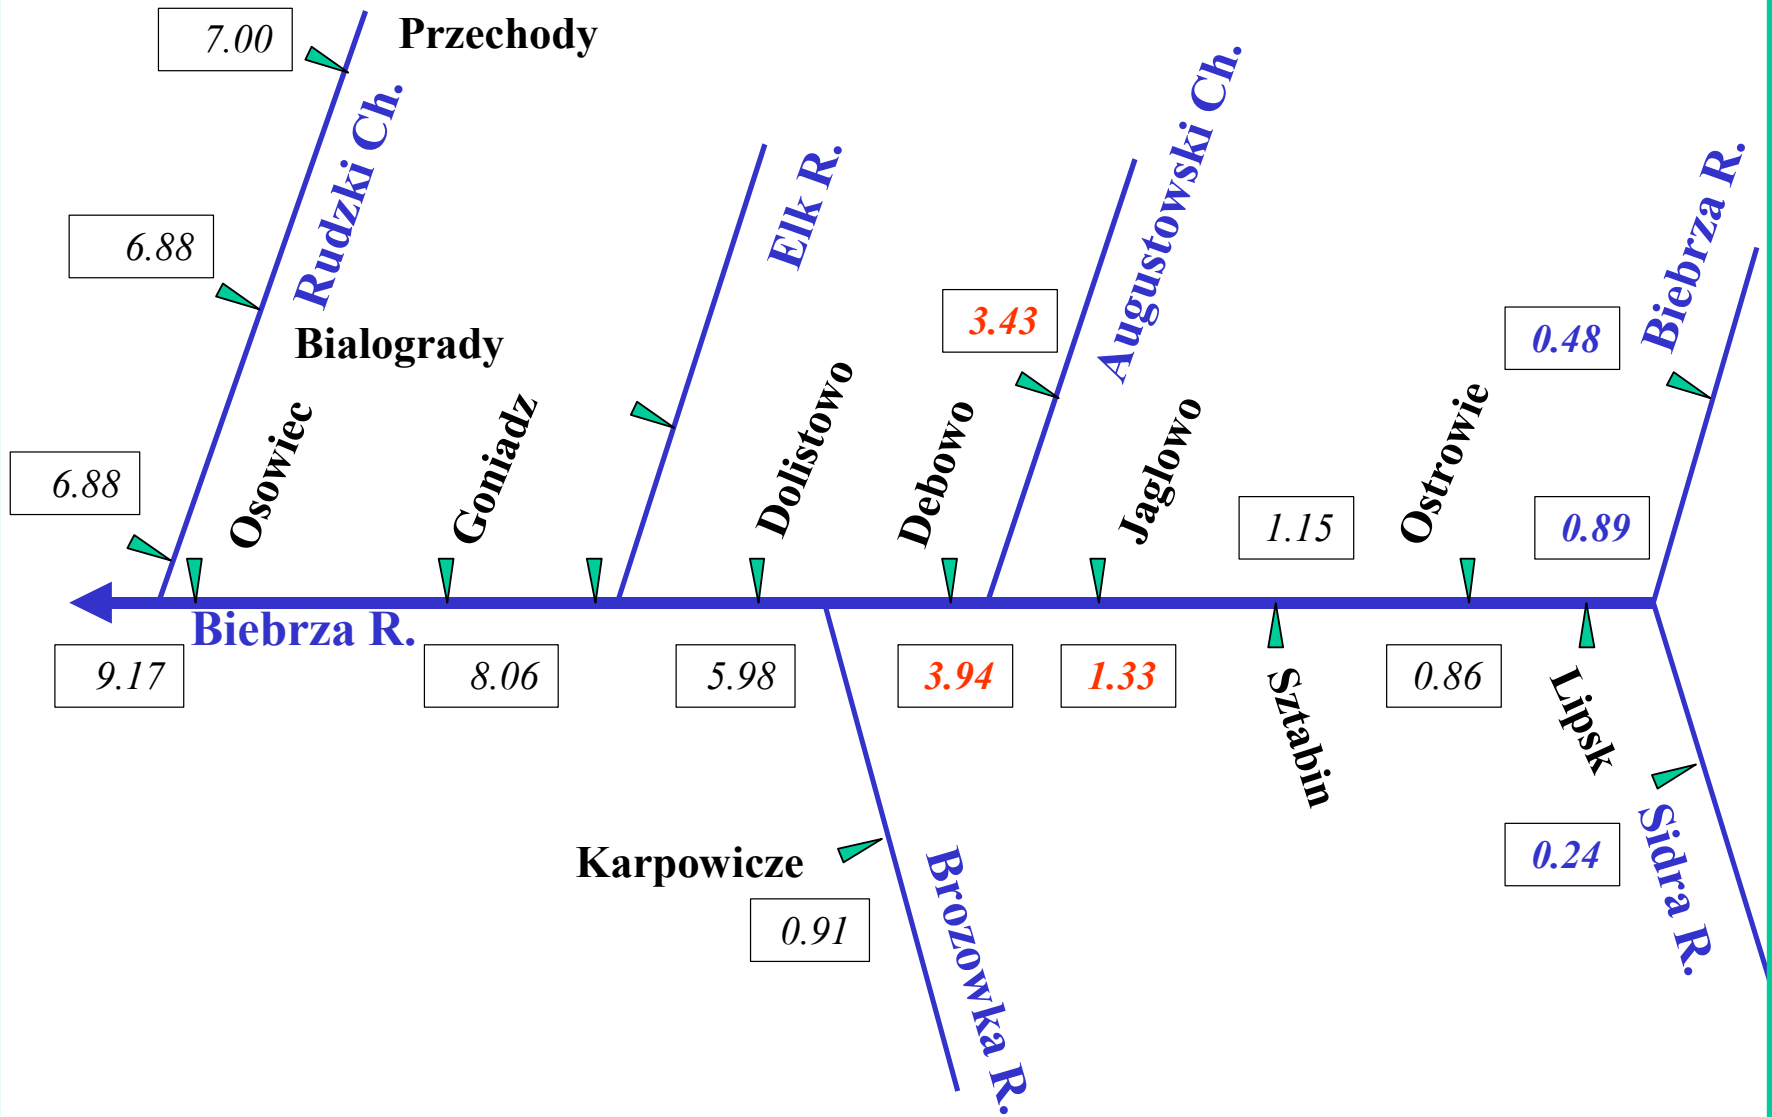

Data collection

Hydraulic data – discharge measurements
> Problems <

Influence of

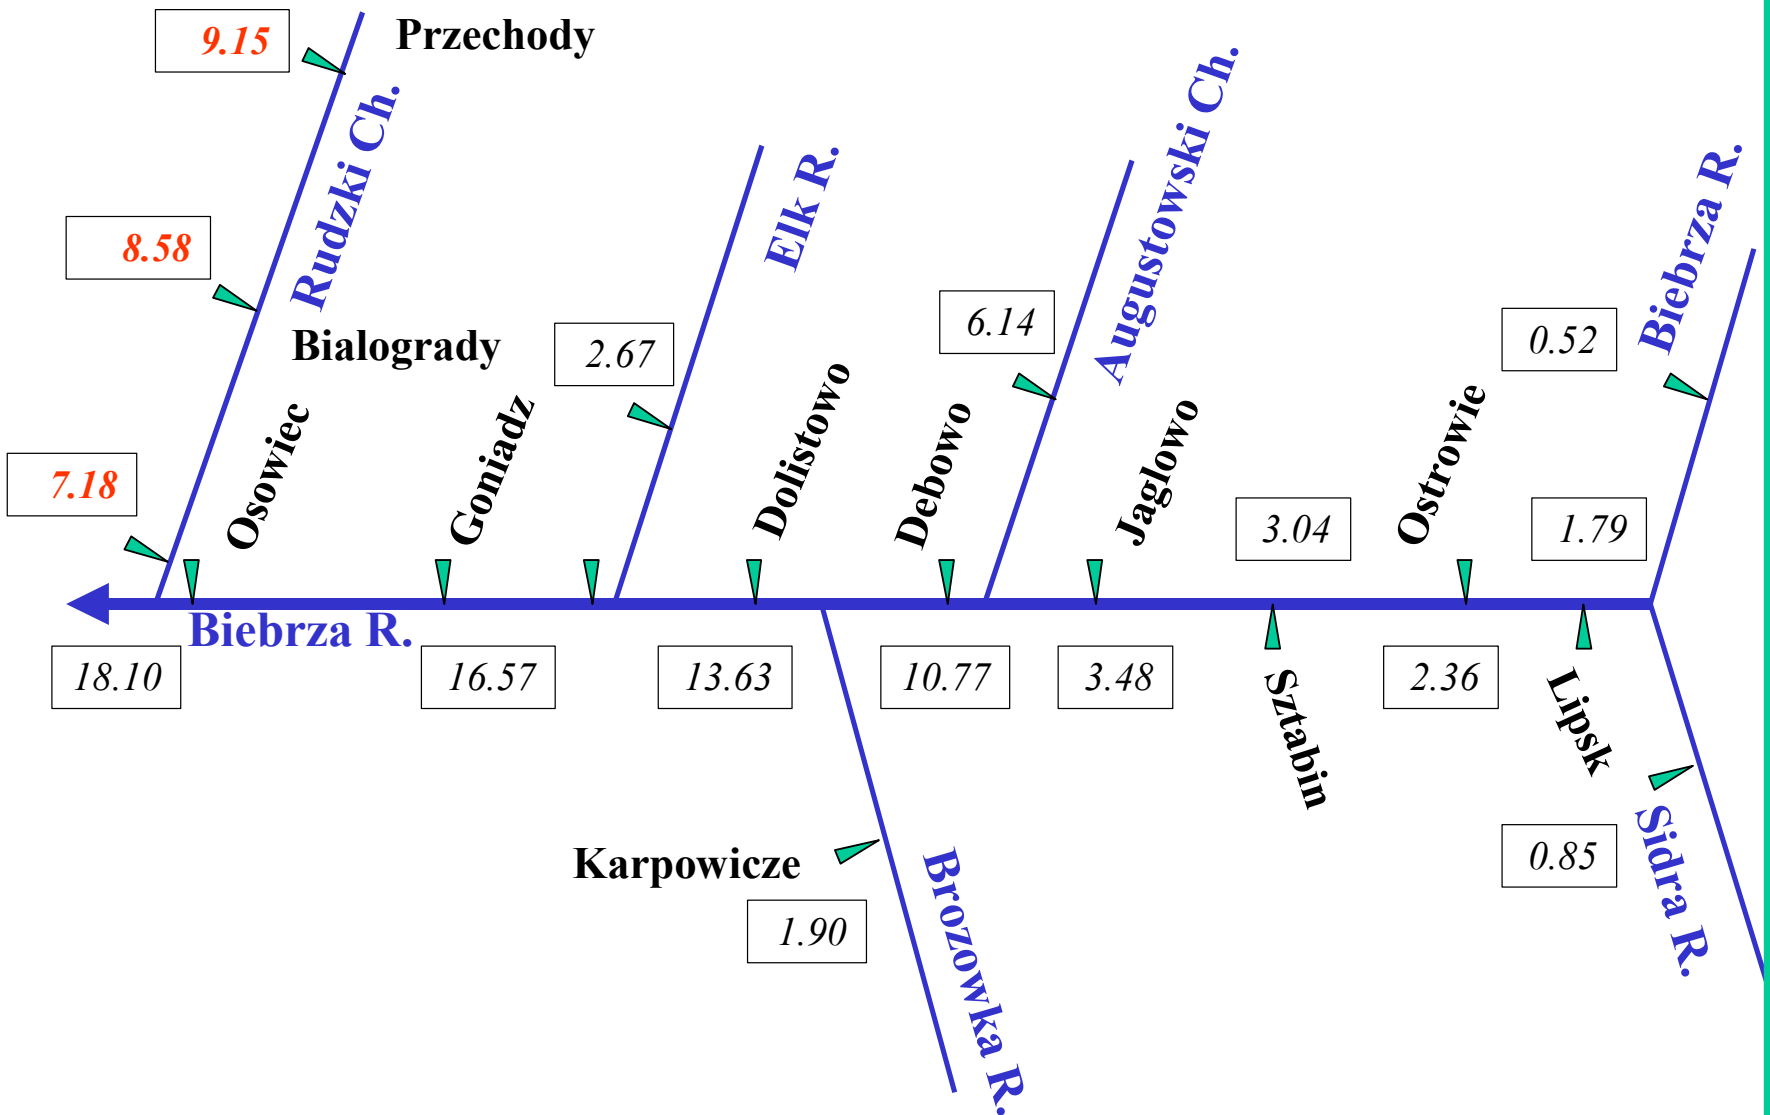

- **Vegetation**
 - velocity fluctuation as a function of time
 - slowing down propeller
 - block the propeller
 - local influence on velocity meter
- **Stones or rocks**
- **Soft bottom**
- **Wind while measuring from a boat**
- **Measuring errors**

Measurement Campaigns: discharges in m³/s

2000

Measurement Campaigns: discharges in m³/s

2003

Input data

How to determine the cross-section?

Input data

How to determine the cross-section?

Solution: define cross-section with A, P and R equal to the average value of all cross-sections

>> Calibration of friction coefficient becomes very important !!!

Input data

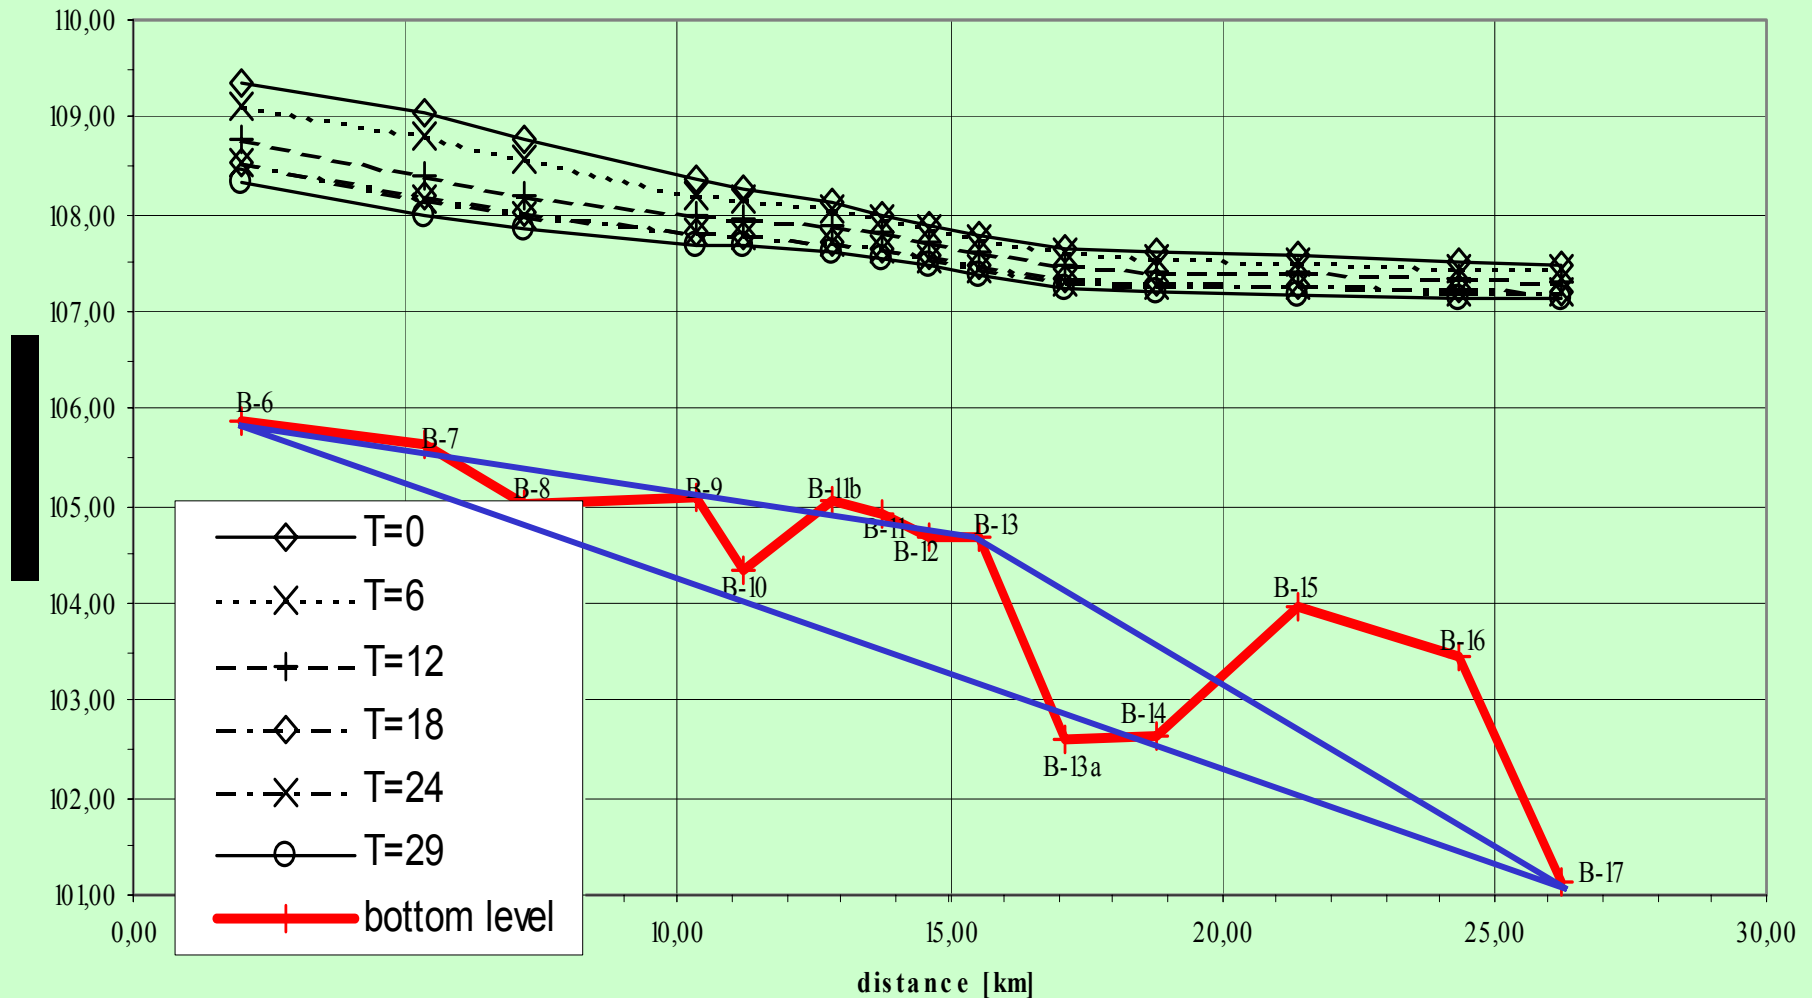

How to determine the longitudinal profile?

Effect of friction!

Input data

Water level variation along the river
from Dolistowo to Osowiec (T = days)

Input data

How to determine the friction coefficient

- $n = f$ (bottom roughness, shape cross-section, vegetation, obstacles, meandering, velocity distribution, ...)
- $n = f$ (time, location, interaction of previous parameters)
- n must be determined from measurements

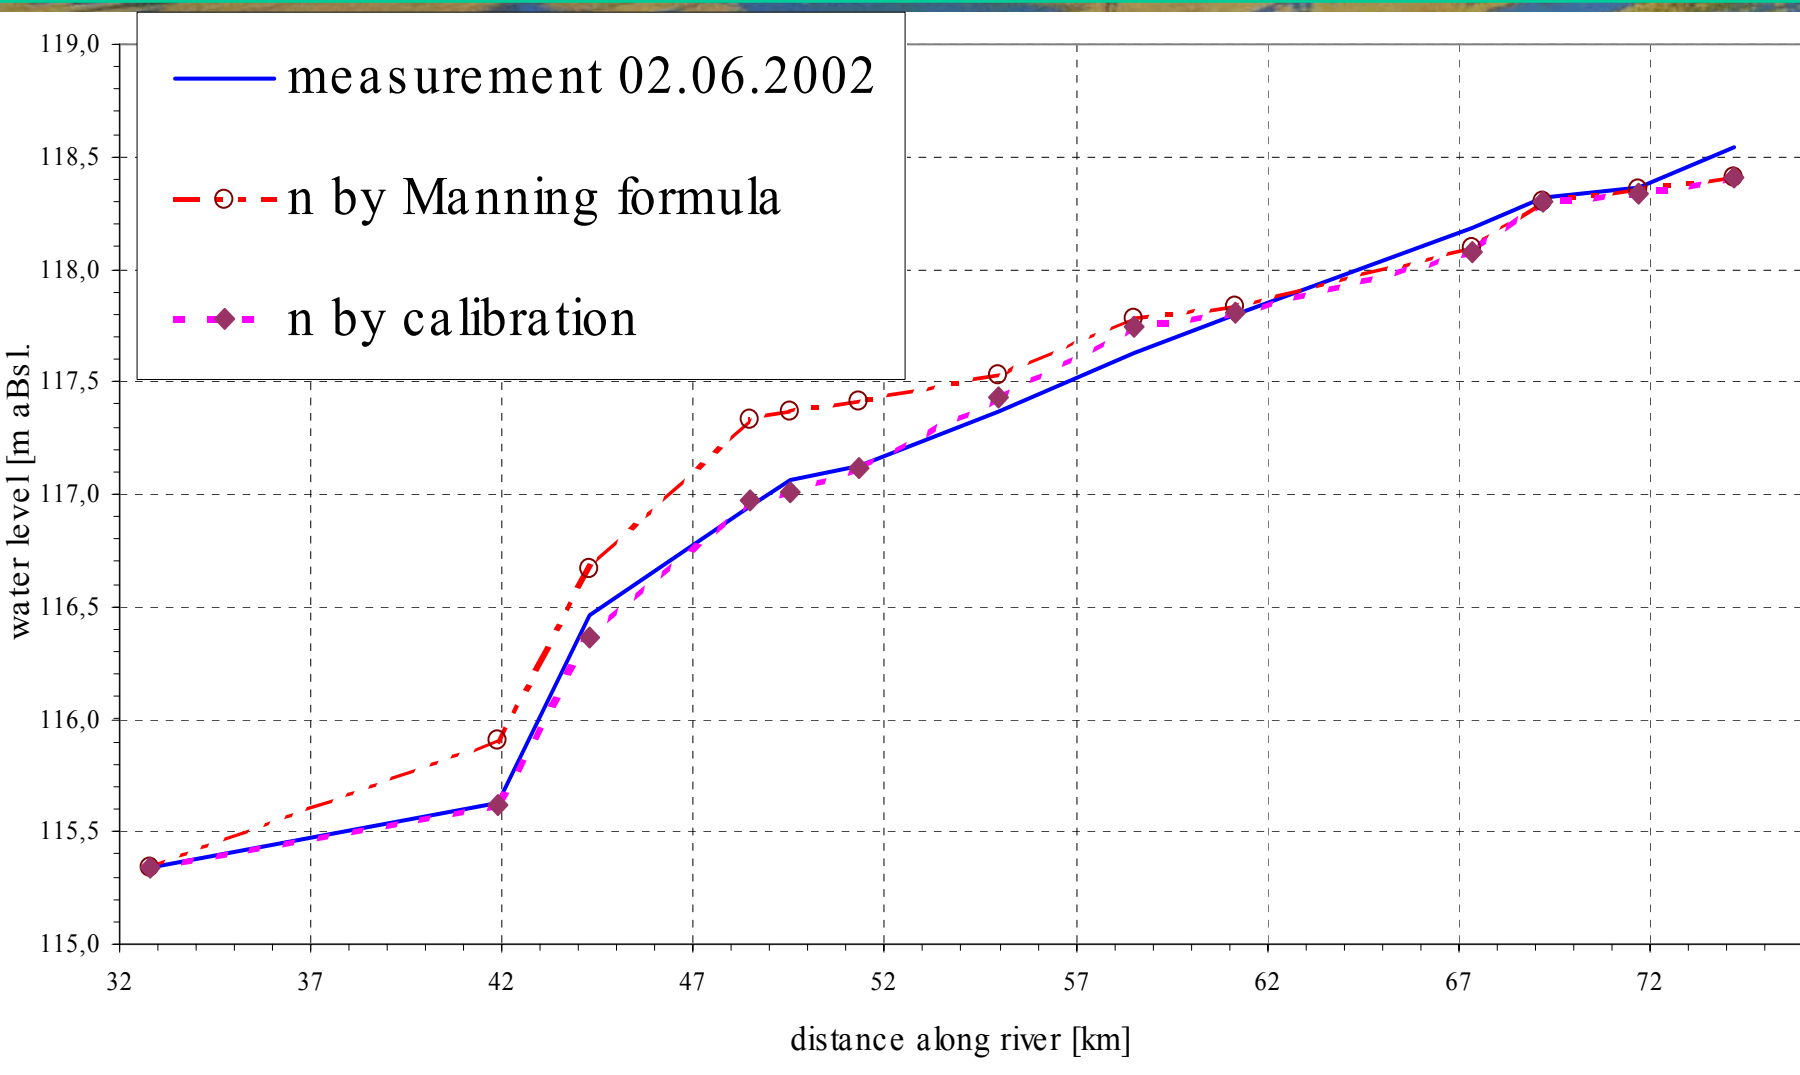

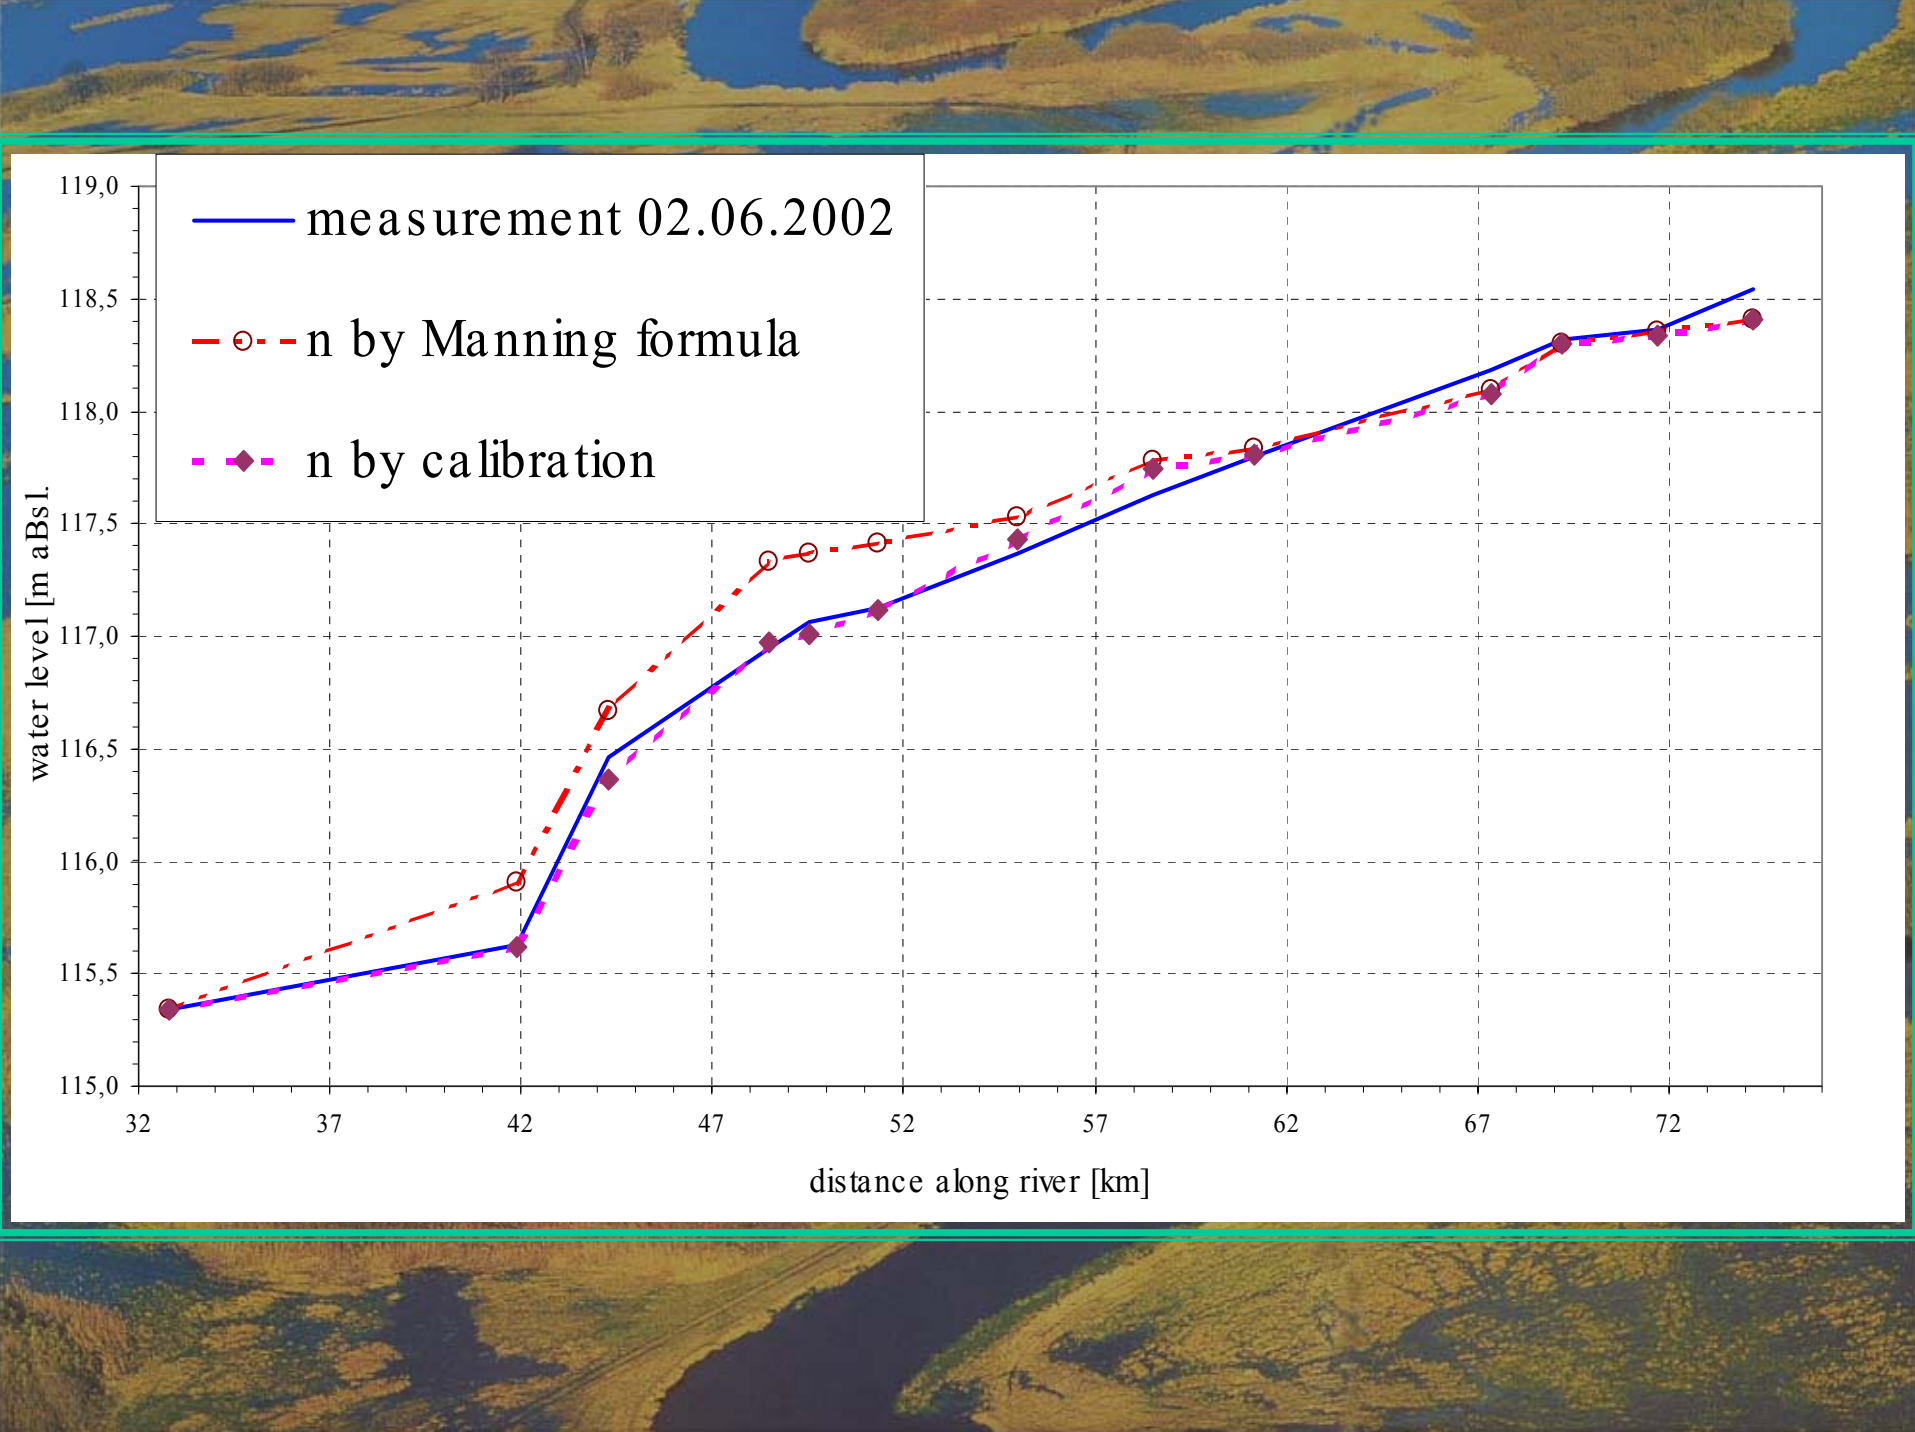

Determination of n using:

- Uniform flow principle (Manning formula)
- Bresse equation

Manning n determination by calibration

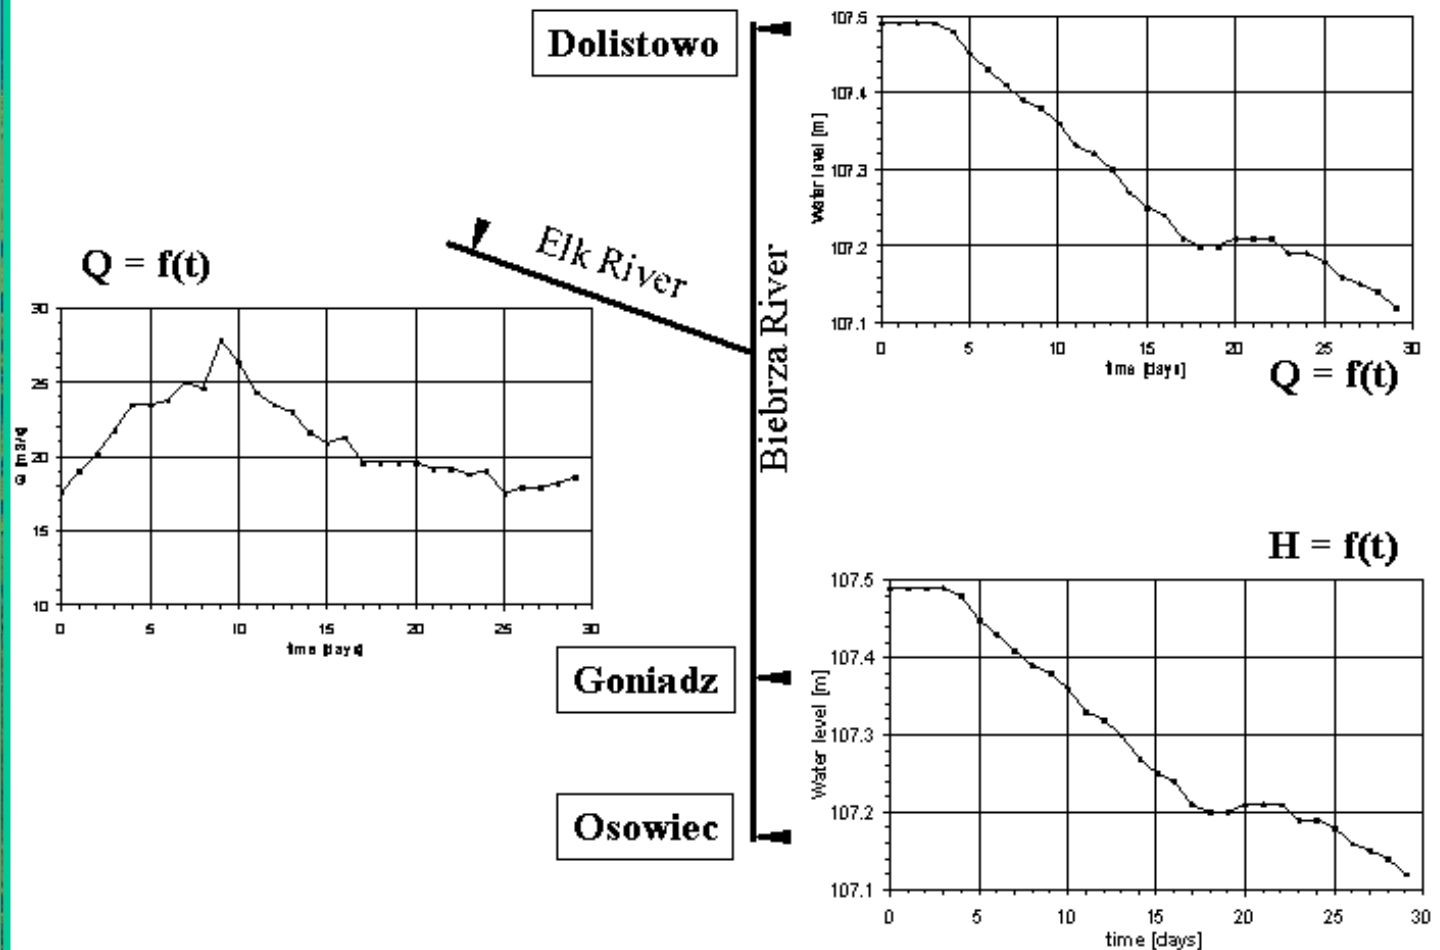

An aerial photograph of a meandering river in a grassy landscape. The river flows from the top right towards the bottom left, forming several large, sweeping loops. The surrounding land is a mix of green and brown grass, with some areas appearing to be flooded or saturated. A dirt road or path is visible, winding through the landscape and crossing the river at several points. In the center of the image, there is a blue rectangular box with a yellow border containing the text "BUT!!!".

BUT!!!

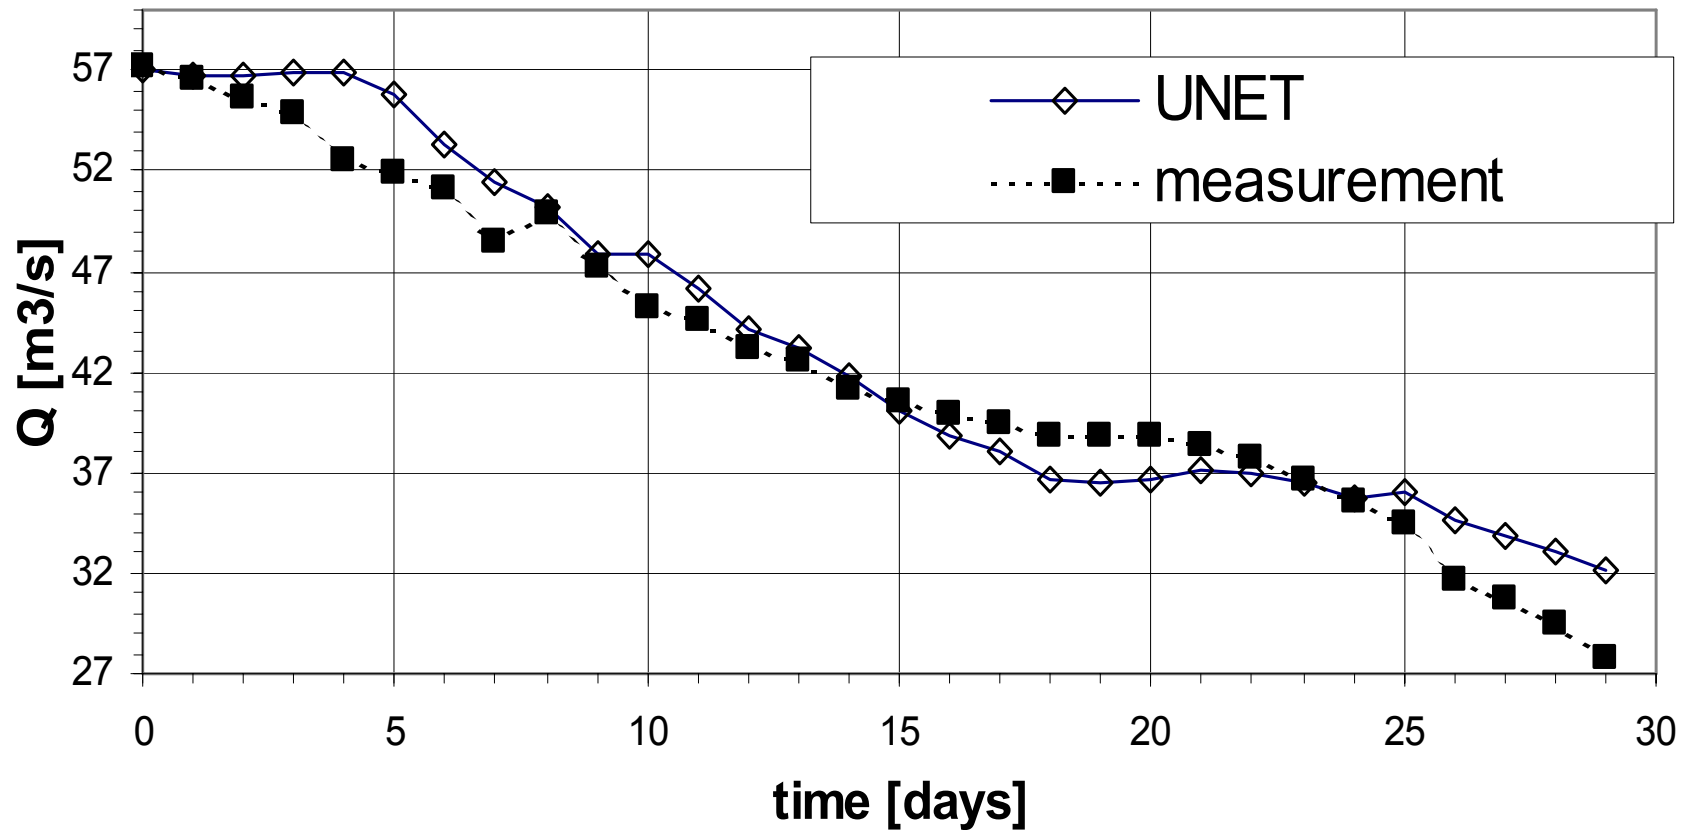

Hydraulic Modelling of open Channel Flow

Mathematical simulation : Boundary conditions

Hydraulic Modelling of open Channel Flow

Discharge variation in Goniadz : B-14

Conclusions and Questions

- **Flood-routing theory is quite simple**
- **Numerical solution methods are well developed**
- **Practical application is confronted with many inaccuracies**
- **Good simulation results thanks to well considered calibration**

- **? Definition of cross-section?**
- **? Determination of longitudinal profile?**
- **? Best way to determine the friction coefficient?**
- **? Suggestions to improve measurements quality?**
